

# Fluid dynamics of the solid Earth (L16)

Dr. Jerome A. Neufeld

The dynamic evolution of the solid Earth is governed by a rich variety of physical processes occurring on a wide range of length and time scales. The Earth's core is formed by the solidification of a mixture of molten iron and various lighter elements, a process which drives predominantly compositional convection in the liquid outer core, thus producing the geodynamo responsible for the Earth's magnetic field. On million year timescales, the solid mantle convects, and as it upwells to the surface it partially melts leading to the volcanism. At the surface, convection drives the motion of brittle plates which are responsible for the Earth's topography as can be felt and imaged through the seismic record. In the Earth's surface, fluids flow through porous rocks as in porous, groundwater aquifers which feed streams and rivers which erode the solid surface. On the Earth's surface, similar physical processes of viscous and elastic deformation coupled to phase changes govern the evolution of the Earth's cryosphere, from the solidification of sea ice to the flow of glacial ice as over land and as ice shelves over the ocean.

This course will use the wealth of observations of the solid Earth to motivate mathematical models of physical processes that play key roles in many other environmental and industrial processes. Mathematical topics will include the onset and scaling of convection, the coupling of fluid motions with changes of phase at a boundary, the thermodynamic and mechanical evolution of multicomponent or multiphase systems, the coupling of fluid flow and elastic flexure or deformation, and the flow of fluids through porous materials. The focus will be on the generation and solution of mathematical models motivated by observational data.

## Desirable previous knowledge

A basic understanding of viscous fluid dynamics. Mathematical methods, particularly the solution of ordinary and partial differential equations.

## Additional support

Three examples sheets will be provided and three associated examples classes will be given. There will be a revision class in the Easter Term.
