

Quantum Computation (M16)

Richard Jozsa

Quantum mechanical processes can be exploited to provide new modes of information processing that are beyond the capabilities of any classical computer. This leads to remarkable new kinds of algorithms (so-called quantum algorithms) that can offer a dramatically increased efficiency for the execution of some computational tasks. In addition to such potential practical benefits, the study of quantum computation has great theoretical interest, combining concepts from computational complexity theory and quantum physics to provide striking fundamental insights into the nature of both disciplines.

This course will be a ‘second’ course in the subject, following the Part II course Quantum Information and Computation (see below in prerequisites) that was introduced in the year 2017-2018.

In this course we will aim to cover the following topics:

- The hidden subgroup problem and quantum Fourier transform on a group;
- The quantum phase estimation algorithm and applications;
- Amplitude amplification and applications;
- Quantum simulation for local hamiltonians;
- The Harrow-Hassidim-Lloyd quantum algorithm for systems of linear equations.

If time permits we may also discuss (or substitute) further topics such as: Introduction to Clifford operations; Classical simulation properties of Clifford circuits (Gottesman-Knill theorem); Measurement based quantum computing; The Pauli based model of quantum computing (Bravyi, Smith and Smolin 2016).

Pre-requisites

This course will assume a prior basic acquaintance with quantum computing, to the extent presented in the course notes for the Cambridge Part II course Quantum Information and Computation available at <http://www.qi.damtp.cam.ac.uk/node/272>

In particular you should be familiar with Dirac notation and principles of quantum mechanics, as presented in the course notes sections 2.1, 2.2 and 2.3. You should also have a basic acquaintance with quantum computation to the extent of the second half of the course notes, pages 47 to 86 (Chapters 6-11). *It would be desirable for you to look through this material before the start of the course.*

Literature

Further useful literature includes the following.

1. Nielsen, M. and Chuang, I., *Quantum Computation and Quantum Information*. CUP, 2000.
2. John Preskill *Lecture Notes on Quantum Information Theory* (especially Chapter 6) available at <http://www.theory.caltech.edu/people/preskill/ph219/>

Additional support

Three examples sheets will be provided and three associated examples classes will be given. There will be a revision class in the Easter Term.
