PAPER 6

NOETHERIAN ALGEBRAS

*Attempt **FOUR** questions.*

*There are **SIX** questions in total.*

*The questions carry equal weight.*

**STATIONERY REQUIREMENTS**

*Cover sheet  
Treasury Tag  
Script paper*

**SPECIAL REQUIREMENTS**

*None*

<p><b>You may not start to read the questions printed on the subsequent pages until instructed to do so by the Invigilator.</b></p>
---

**1** State and prove the non-commutative version of Hilbert's Basis Theorem.

Define a poly-(cyclic or finite) group. Stating clearly any results that you use in addition to the basis theorem, show that the group algebra  $\mathbb{Z}G$  is Noetherian whenever  $G$  is a poly-(cyclic or finite) group.

**2** Let  $R$  be a commutative ring and  $S$  a multiplicatively closed subset of  $R$ . Define the localisation  $R_S$  of  $R$  at  $S$  using its universal property and sketch the proof that it exists.

Explain what it means to localise  $R$  at a prime ideal  $P$  of  $R$ . Show that  $R_P$ , the localisation of  $R$  at  $P$  is always a local ring.

Suppose that  $R_P$  contains no non-trivial nilpotent element for each prime ideal  $P$  of  $R$ . Show that  $R$  contains no non-trivial nilpotent elements.

Suppose now that  $R_P$  is an integral domain for each prime ideal  $P$ . Must  $R$  be an integral domain? Justify your answer.

**3** Show, using Zorn's Lemma, that every ring  $R$  has a simple left  $R$ -module.

Define the Jacobson radical  $J(R)$  of a ring  $R$ . Show that  $J(R)$  consists of all elements  $x$  in  $R$  such that  $1 - axb$  is a unit in  $R$  for every  $a$  and  $b$  in  $R$ .

Suppose now that  $R$  is commutative and  $I$  is an ideal in  $R$ . Show that the set  $S = 1 + I$  is multiplicatively closed and that the localisation  $I_S$  of  $I$  is contained in  $J(R_S)$ .

**4** State and prove the Artin–Wedderburn Theorem.

Deduce that if  $G$  is a finite group and  $S_1, \dots, S_k$  are all the simple  $\mathbb{C}G$ -modules up to isomorphism then

$$\sum_{i=1}^k (\dim_{\mathbb{C}} S_i)^2 = |G|.$$

You may assume that the Jacobson radical of  $\mathbb{C}G$  is 0.

**5** Define an almost commutative  $\mathbb{C}$ -algebra. Show that if  $R$  is an almost commutative  $\mathbb{C}$ -algebra then  $R$  is Noetherian. Deduce that if  $\mathfrak{g}$  is a finite dimensional  $\mathbb{C}$ -Lie algebra then the universal enveloping algebra  $\mathcal{U}(\mathfrak{g})$  is Noetherian.

**6** Let  $R$  be a left Noetherian ring and  $M$  a finitely generated left  $R$ -module. Show that  $M$  has a projective resolution consisting of finitely generated projective modules.

Deduce that if  $M$  has projective dimension  $n < \infty$  then  $\text{Ext}_R^n(M, R) \neq 0$ .

Find a ring  $R$  and an  $R$ -module  $M$  such that  $M$  does not have finite projective dimension as an  $R$ -module.
