PAPER 114

ALGEBRAIC TOPOLOGY

Attempt no more than FOUR questions.

There are FIVE questions in total.

The questions carry equal weight.

You may not start to read the questions printed on the subsequent pages until instructed to do so by the Invigilator.
For a continuous map $f : X \to X$, let $T_f = (X \times [0,1]) / \sim$, where $(x,0) \sim (f(x),1)$. Show that there is a long exact sequence

$$\cdots \to H_n(X;\mathbb{Z}) \xrightarrow{id-f_*} H_n(T_f;\mathbb{Z}) \to H_{n-1}(X;\mathbb{Z}) \xrightarrow{id-f_*} H_{n-1}(X;\mathbb{Z}) \to \cdots$$

An invertible $2 \times 2$ matrix $A$ with integer entries gives a homeomorphism of $\mathbb{R}^2$ which preserves $\mathbb{Z}^2$, and hence defines a homeomorphism $f_A$ of the torus $X = \mathbb{R}^2 / \mathbb{Z}^2$. Show that the map $(f_A)_* : H_1(X;\mathbb{Z}) \to H_1(X;\mathbb{Z})$ is given by the matrix $A$, with respect to a basis which you should describe. Show that the map $(f_A)_* : H_2(X;\mathbb{Z}) \to H_2(X;\mathbb{Z})$ is given by multiplication by $\det(A)$. Hence compute the integral homology groups of $T_{fA}$ when

$$A = \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix}.$$

Without using cellular homology, carefully calculate the integral homology of $S^n$, making clear all results which you use. Let $f : S^n \to S^n$ be a continuous map. What is the degree of the map $f$? What is the local degree of the map $f$ at a point $x_0 \in S^n$, and when is it defined? State and prove a result expressing the degree of $f$ in terms of local degrees.

Define the canonical 1-dimensional real vector bundle $\pi : \gamma_{1,n}^{\mathbb{R}} \to \mathbb{RP}^n$, and prove that it is locally trivial. Describe the Gysin sequence associated to an $\mathbb{R}$-oriented vector bundle. Hence compute the cohomology ring $H^*(\mathbb{RP}^n; \mathbb{F}_2)$.

If $f : S^n \to S^m$ is a continuous map such that $f(-x) = -f(x)$, show that $n \leq m$.

If $g : S^n \times S^n \to S^n$ is a continuous map such that $g(-x,y) = -g(x,y) = g(x,-y)$, show that $n = 2^k - 1$ for some integer $k$.

Compute the effect of the inclusion map $i : \mathbb{RP}^2 \to \mathbb{CP}^2$ on $\mathbb{F}_2$-cohomology. By considering the pair $(\mathbb{CP}^{2k}, \mathbb{CP}^{2k} \setminus \mathbb{RP}^{2k})$, show that $\mathbb{CP}^{2k} \setminus \mathbb{RP}^{2k}$ has the same $\mathbb{F}_2$-cohomology ring as $\mathbb{CP}^{2k-1} \times S^{2k}$. State carefully all results which you use.
Let $F$ be a field. State the Poincaré duality theorem for a compact $F$-oriented manifold $M$, and prove that it provides a non-singular bilinear form on $H^*(M; F)$.

Let $W_g$ be a manifold obtained as the connect-sum of $g$ copies of $S^{2n+1} \times S^{2n+1}$. Compute the integral cohomology ring of $W_g$, stating carefully all results which you use. If $f : W_g \to W_g$ is a smooth orientation preserving map such that $f \circ f = id_{W_g}$, and whose fixed points form a discrete set $\text{Fix}(f)$, show that

$$\# \text{Fix}(f) \equiv 2 - 2g \mod 4.$$

[You may assume that under the stated conditions on $f$ one has $\det(I - D_x f) > 0$ for all $x \in \text{Fix}(f)$. You may use that a finite dimensional real vector space which admits a non-singular skew-symmetric bilinear form is even dimensional.]
